FEATURES

```
(http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwalot (gri #772114[gb]AP1290721); a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xiii0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AZ826822 30 bp DNA linear GSS 20-PEB-2001 2M0102013R Mouse 10kb plasmid UUGCIM library Mus musculus genomic clone UUGC2M0102013 R, genomic survey sequence.

(http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMO42 (gil 4742114)[b]AP129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pwM92 (gil#732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Unpublished

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil 4792114) [ablant 20072.1], a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xilo-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Contact: Robert B. was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwlor (gf 147221141gb] AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Biomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT

COMMENT

TITLE

us-09-540-843-8.szlm30.rst

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb]AP129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into adaptored vector E oli KL10-Gold (stratagene) cells and selected for ampicillin resistance."

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pwwl2 (gi | 4742114|gb|AF129072.1), a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll Xiii0-Gold (Stratagene) cells and selected for ampicillin resistance."

/ Jab host="E. Coli strain XL10-Gold, T1-resistant, F-"
/ Jab host="E. Coli strain XL10-Gold, T1-resistant, F-"
/ Clone lib="Whouse loke plasmid UNGCIM library
/ Clone lib="Weator: PWD4Zuv; Purified genomic DNA from
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil 4772114 [gb] AF125072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pMAQ2 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli xi10.Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (http://www.jax.org/resource
(http://www.jax.org/resources/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pMO42 (gil 4732114 |gb|AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the innert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

Nucleic acid sequences are used to generate universal probes and primers which can be used to identify and detect the presence of algal, archaeal, bacterial, fungal and parasitical species in a test sample -

Claim 21, Page 1456; 1580pp; English.

The present invention describes a method for generating a repertory of nucleic acids of tuf, fus, atpD and/or recA genes from which probes and/or primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more related microorganisms e.g. algae, archaeal, bacterial, fungal and parasites, for universal detection and for specific and ubiquitous detection and identification of an algal, archaeal, bacterial, fungal and parasitical species, genus, family and group. A nucleic acid (I) obtained using the method of the invention can be used for the universal detection of any bacterium, fungus or parasite in a sample and for the detection of at least one antimicrobial agent resistance gene or at least one toxin gene. hack mucleic acids are used for the specific and ubiquitous detection and for identification of Streptococcus pneumoniae. (I) can be used to design a therapeutic agent which is effective against microorganisms. Macrobial species or genus or family or phylum or group which can be detected include Abiotrophia adiacens, Bordetella sp., Neisseria gonorrhoeae and Staphylococcus sp.. Using DNA based tests provides faster results than substrate specificity tests as results can nucleotide sequences and primers/probes Corynebacterium sp., Enterobacteriaceae group, Escherichia coli, Mycobacteriaceae family, Pseudomonads group, Streptococcus sp., determined in an hour and improved accuracy is also achieved. which are given in the exemplification of the present invention to AAH002304 represent XX

```
The present invention discloses a novel human zinc finger protein 8.8, polynuclectide coding for the polypeptide and method for producing this polypeptide by using DNA recombination technology. The invention also discloses the method for curing several diseases, such as malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, polypeptide. The invention also discloses and various inflammations by using the polypeptide and its therapeutic action and also discloses the spapication of the polymucleotide for coding this novel zinc finger protein 8.8. The sequence presented is the reverse transcription (RT) PCR primer, #2, which was used to isolate human zinc finger protein

The invention relates to a method of inducing, promoting or otherwise facilitating a change in the phenotype of an animal cell or group of animal cells. The modulation of phenotypic expression is conveniently accomplished via genotypic manipulation through such means as reducing translation of transcript to proteinaceous product. The ability to induce, promote or otherwise facilitate the silencing of expressible genetic sequences provides a means for modulating the phenotype in, for example, the medical, veterinary and the animal husbandry inclustries. Genetic construct comprising nucleotide sequence substantially identical to target endogenous sequence of nucleotides is in the genome of a vertebrate animal cell, is useful for altering the phenotype of a vertebrate animal cell, where the phenotype is conferred or otherwise facilitated by the expression of an endogenous conferred or otherwise facilitated by the expression of an endogenous conferred or otherwise facilitated by the expression of an endogenous in gene therapy in a vertebrate animal (e.g. human, primate, livestock animal, laboratory test animal or a murine species, avian species, fish or reptile. The present sequence is a double-stranded DNA probe used for a lectromobility shift assay (EMSA) of Oct-factor proteins, N-Oct-1 and N-Oct-3. This sequence is used in the co-suppression of Brn-2 transcription factor, which belongs to a class of Oct-factors; in MM95L
                                                                                                                                                                                                                                                                                Genetic construct for generating transgenic animal cells and in gene therapy of vertebrate animal, comprises nucleotide sequence identical to endogenous target sequence in the genome of vertebrate animal cell

                                                                                                                                                                                       WPI; 2001-596939/67
                                                                                                  Graham MW,
         The invention relates to a method of inducing, promoting or otherwise facilitating a change in the phenotype of an animal cells or group of animal cells. The modulation of phenotypic expression is conveniently carcomplished via genotypic manipulation through such means as reducing translation of transcript to proteinaceous product. The ability to induce, promote or otherwise facilitate the silencing of expressible genetic sequences provides a means for modulating the phenotype in, for example, the medical, veterinary and the animal husbandry industries. Genetic construct comprising nucleotide sequence substantially identical to target endogenous sequence of nucleotides in the genome of a vertebrate animal cell, where the phenotype is conferred or otherwise facilitated by the expression of an endogenous the phenotype of a vertebrate animal cell, where the phenotype is conferred or otherwise facilitated by the expression of an endogenous of gene, and also in the generation of animal (e-glis, luman, primate, livestock animal, laboratory test animal or a murine species, avian species, fish or reptile. The present sequence is a double-stranded DNA probe derived from simian virus 40 (SV40) enhancer sequence and is used for electromobility shift assay (EMSA) of oct-factor proteins, N-Oct-1 and N-Oct-3. This sequence is a used in the co-suppression of Energy i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 N-Oct-3. This sequence is used in the co-suppression of Brn-2 transcription factor, which belongs to a class of Oct-factors, in MM96L
                                                                                                                                                                                                                                                                       Genetic construct for generating transgenic animal cells and in gene therapy of vertebrate animal, comprises nucleotide sequence identical to endogenous target sequence in the genome of vertebrate animal cell

Sequences of the invention are useful for therapeutic purposes, e.g., for treating cancer, for diagnosing or preventing cancer, as an immunogen to produce antibodies or for in vitro purposes related to scientific research, synthesis of DNA and manufacture of DNA vectors. The present DNA sequence is a PCR primer which is used for amplifying human MLH1 CDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated human DNA repair polypeptide useful for diagnosing, preventing or treating cancer, or for in vitro purposes related to scientific research, synthesis of DNA and manufacture of DNA vectors

The invention describes an isolated polynucleotide encoding a human DNA repair protein, which is designated human mut L homologue 1 (HMLH1). The DNA repair polynucleotide is useful for diagnostic or therapeutic purposes. The polynucleotide may be used in diagnosing or treating cancer, e.g. lung cancer, prostate cancer, ovarian cancer, breast cancer, colon cancer or stomach cancer. The DNA repair polynucleotide is particularly useful for correcting errors made during DNA replication and particularly useful for diagnosing a hereditary susceptibility to cancer. This sequence represents a primer used to sequence a region of the DNA repair protein human mut L homologue 1 (HMLH1) gene in order to
                                                                                                                                                                                                                                        New human DNA mismatch repair polynucleotides and proteins, useful for diagnosing or treating cancers (e.g. lung, prostate, ovarian or breast cancer), or for correcting errors made during DNA replication and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR primers AAA15193-94 were used to amplify DNA downstream of tatA. The specification describes describes virulence proteins which are encoded by an operon including tatA, tatB, tatB, tatB, mdoG, creC, recG, yggN, eckl, irob, iroC, irob, mtd2 or ms1-16 genes obtained from Escherichia coli K1. The virulence proteins and polynucleotides, and their vaccines are useful for screening potential drugs, for the detection of virulence, and for treating or preventing conditions associated with infection by a Gram negative bacterium particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide encoded by an operon including genes from Escherichia coli for screening potential drugs, detecting virulence and treating conditions associated with infection by a Gram negative bacterium -
Probe #2 (AAQ46967) hybridises to, and is specific for, the 16S rRNA S.pyogenes. Hybridisation was enhanced by the use of "helper probes" AAQ46911 and AAQ46971. The probe can be used alone or in a mix with other S.pyogenes-specific probes to distinguish S.pyogenes from closely related bacteria (i.e. other Streptococcus spp.).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to loblolly pine polynucleotides with one or more Simple Sequence Repeats (SSRs) (see AAA74026-A4322). SSRs are also known as microsatellite DNA repeats. The SSRs are useful as genetic markers for genetic mapping, population genetics studies and inheritance studies in various plant breeding programmes. The present sequence is a PCR primer used for detecting the presence of a SSR locus in a pine genomic DNA sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polynucleotide having simple sequence repeat useful as markers in plants for genetic characterization e.g. genetic mapping study, an inheritance study of a commercially important trait in a plant breeding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               microsatellite DNA repeat; genetic marker; mapping; inheritance study; population genetics study; plant breeding programme; ss.

S'.RY-CpG-RY-3'. The central CpG motifies unmethylated, and the coligonucleotides optionally have phosphorothioate linkages which make them were resistent to degradation. The invention also relates to an oligonucleotide delivery comprising an oligonucleotide of the invention and a targetting agent, and a pharmaceutical composition comprising the oligonucleotide delivery complex. The oligonucleotides are able to induce either a cell-mediated (T-cell) response or a humoral (B-cell, antibody) response, with oligonucleotides of the sequence of the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           solid tumour cancer. The induction of an immune response is used in antisense therspy and to improve the efficacy of a vaccine. The oligonucleotide is preferably administered to lymphocytes ax vivo, producing activated lymphocytes which are then administered to the host.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents an immunogenic CpG oligodeoxynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               unmethylated CpG; oligdideoxynucleotide; ODN; virucide; vaccine; Paramyxoviridae; F protein; respiratory syncytial virus; RSV; viral bronchiolitis; pneumonia; infectious pulmonary disease; bronchopulmonary dysplasis; congenital heart condition; ss.

Vaccine for immunising patient against respiratory syncytial virus, has epitopes of Paramyxoviridae P protein, and cytosine followed by guanine linked by phosphate bond-oligodideoxynucleotides
                                                                                                                                                                                                             The invention describes a vaccine comprising one or more epitopes of a Paramyxoviridae F protein, and one or more CpG (cytosine followed by guanine linked by phosphate bond)-oligodideoxynucleotides (ODNS). The vaccine is useful for vaccinating a patient especially against viruses of the Paramyxoviridae family e.g. reepiratory syncytial virus (RSV), the primary cause of viral bronchiolitis and pneumonia in infants and children, and infectious pulmonary disease in infants. RSV has been particularly implicated in death of infants that are premature, have bronchopulmonary displasia, or congenital heart conditions. This sequence represents an oligodideoxynucleotide that can be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            O; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               group A beta-haemolytic Streptococcus; S.pyogenes; ribosomal RNA; respiratory tract infection; sinusitis; pharyngitis; meningitis; tonsillitis; septicaemia; pyoderma; endocarditis; impetigo;

Primers DK15 (AAT29050) and DK16 (AAT29051) were used for the PCR amplification of the ribosome binding site and signal peptide coding regions of the Bacillus stearothermophilus maltogenic alpha-amylase gene in pDN520. The PCR product was used to construct pPPFI, which also carried a gene (AAT29043) for Oerskovia xanthineolytica beta-1,3-glucanase (AAR97362). Transformation of Bacillus subtilis strain DN1885 or protease-deficient strain 70046 allowed prodn. of the Oerskovia lytic enzyme.

Oligodeoxynucleotides for inducing an immune response to treat and prevent an allergic reaction, cancer, an autoimmune disorder and symptoms resulting from exposure to bio-warfare agents, comprise Claim 5; Page 43; 48pp; English. multiple CpG sequences

nucleotides comprising multiple CpG sequences, where one of the CpG sequences is different from another of the multiple CpG sequences. The ODN are useful for inducing an immune response, preferably a cell-mediated immune response, involving non-B cell activation, interferon gamma (IRN-gamma) production or a humoral immune response involving B cell activation, antibody and interleukin-6 production in a host, for treating, preventing or ameliorating an allergic reaction, e.g. asthmacancer, e.g. solid tumour cancer, a disease associated with the immune AAS09551-AAS09662 represent oligodeoxynucleotides (ODN) of at least 10

or a symptom resulting from exposure to bio-warfare agent in a human. The induction of immune response improves the efficacy of a vaccine and is used in antisense therapy. The ODN are useful for treating, preventing or ameliorating allergic reactions, including eczema, allergic rhinitis or coryza, hay fever, bronchial asthma, urticaria (hivès), food allergies and other atopic conditions, for improving the efficacy of vaccines against hepatitis A, B and C, human immunodeficiency virus (HIV) and malaria, for treating immune system deficiencies, e.g. lupus erythematosus and autoimmune diseases such as rheumatoid arthritis and multiple sclerosis, infections including Francisella, schistosomiasis, tuberculosis, acquired immunoselficiency syndrome (AIDS), Leishmania and symptoms resulting from exposure of bio-warfare agent, including Ebola, system e.g. autoimmune disorder or an immune system deficiency, infection Anthrax and Listeria.

Novel oligonucleotides useful for the prevention and treatment of allergies, cancer, and autoimmune disorders and for ameliorating symptoms resulting from exposure to a bio-warfare agent

Claim 4; Page 38; 46pp; English.

The invention relates to novel immunogenic CpG oligodeoxynucleotides (AAC80581-C80723). The oligonucleotide are at least 10 bases long

cell and reducing

                                                                                                                                                  AAZ10692-97 represent DNA fragments that are used for increasing p53 activity in a cell. The oligonucleotides are are UV minetics and protect cells against subsequent exposure to UV-irradiation or chemicals. The oligonucleotides are useful for increasing p53 activity in a cell, reducing the susceptibility to UV-induced hyperproliferative diseases, treating psoriasis, vitiligo, atopic dermatitis, allergic rhinitis, conjunctivitis, and UV-induced dermatoses, reducing photoaging
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Inhibiting proliferation of epithelial cells, useful e.g. for treating carcinoma, using specific oligonucleotides that mimic the effects of ultra-violet light
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes inhibition of mammalian epithelial cell proliferation by treating cells with at least one oligonucleotide, its fragment. The compounds, which have cytostatic, anti-allergic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        melanogenic; oligomer; cytostatic; anti-allergic; p53;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 20; DB 20; Length 2

anti-inflammatory, dermatological, ophthalmological, anti-psoriatic and immunosuppressive activities, function as 'ultra-violet mimics' to induce DNA repair processes (or a protective response to later exposure to radiation or chemicals), as a proliferation inhibitor, apoptosis inducer or a tumour necrosis factor inhibitor. Probably they mimic products of DNA damage, or processed DNA-damage intermediates, by inducing the p53 pathway, resulting in transient arrest of cell growth, allowing more time for DNA repair to occur before cell division takes place. The method is capecially used to treat cardinoma but may also be used to: treat other hyperproliferative states (e.g. psoriasis or precancerous conditions); reduce photoaging, oxidative stress or damage; prevent skin cancer; treat allergic rhinitis and conjunctivitis); prevent or reduce DNA damage in cells caused by radiation or chemicals; increase melanin production (pigmentation) in epithelial cells (e.g. for treating vitiligo), and to (pigmentation) in epithelial cells that contain damaged DNA. Also coligomucleotides that contain non-hydrolyzable backbones are used to inhibit apoptosis, in response to DNA damage, in epithelial cell This esquence is melanogenesis associated oligomucleotide #8, a synthetic of Thymine dimers and one of the oligomucleotides used to inhibit mammalian cell the intention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA construct encoding enzyme with beta-1,3-glucanase activity useful for modifying or degrading beta-glucan contg. material and in the prepn. of e.g. food colourants, flavourings and yeast extracts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Beta-1,3-glucanase; Cellulomonas cellulans; Bacillus subtilis; lytic enzyme; beta-glucan degradation; cell wall lysis; pigment; flavour; yeast extract; protoplast; costskovia xanthineolytica; polymerase chain reaction; primer; PCR; alpha-amylase; signal peptide; Bacillus stearothermophilus;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GENERAL INFORMATION:
APPLICANT: Grandgenett, Duane
TITLE OF INVENTION: An in vitro method for concerted integration of
TITLE OF INVENTION: donor DNA molecules using retroviral integrase proteins.
NUMBER OF SEQUENCES: 7
CORRESPONDENCE ADDRESS:
ADDRESSEE: Grandgenett, Duane
